

# Anxiety (General Anxiety Disorder)

## Symptoms

Generalized anxiety disorder symptoms can vary. They may include:

- Persistent worrying or anxiety about a number of areas that are out of proportion to the impact of the events
- Overthinking plans and solutions to all possible worst-case outcomes
- Perceiving situations and events as threatening, even when they aren't
- Difficulty handling uncertainty
- Indecisiveness and fear of making the wrong decision
- Inability to set aside or let go of a worry
- Inability to relax, feeling restless, and feeling keyed up or on edge
- Difficulty concentrating, or the feeling that your mind "goes blank"

Physical signs and symptoms may include:

- Fatigue
- Trouble sleeping
- Muscle tension or muscle aches
- Trembling, feeling twitchy
- Nervousness or being easily startled
- Sweating
- Nausea, diarrhea or irritable bowel syndrome
- Irritability

There may be times when your worries don't completely consume you, but you still feel anxious even when there's no apparent reason. For example, you may feel intense worry about your safety or that of your loved ones, or you may have a general sense that something bad is about to happen.

Your anxiety, worry or physical symptoms cause you significant distress in social, work or other areas of your life. Worries can shift from one concern to another and may change with time and age.

### **Symptoms in children and teenagers**

Children and teenagers may have similar worries to adults, but also may have excessive worries about:

- Performance at school or sporting events
- Family members' safety
- Being on time (punctuality)
- Earthquakes, nuclear war or other catastrophic events

A child or teen with excessive worry may:

- Feel overly anxious to fit in
- Be a perfectionist
- Redo tasks because they aren't perfect the first time
- Spend excessive time doing homework
- Lack confidence
- Strive for approval
- Require a lot of reassurance about performance
- Have frequent stomachaches or other physical complaints
- Avoid going to school or avoid social situations

## Causes

As with many mental health conditions, the cause of generalized anxiety disorder likely arises from a complex interaction of biological and environmental factors, which may include:

- Differences in brain chemistry and function
- Genetics
- Differences in the way threats are perceived
- Development and personality

## Risk factors

Women are diagnosed with generalized anxiety disorder somewhat more often than men are. The following factors may increase the risk of developing generalized anxiety disorder:

- **Personality.** A person whose temperament is timid or negative or who avoids anything dangerous may be more prone to generalized anxiety disorder than others are.
- **Genetics.** Generalized anxiety disorder may run in families.
- **Experiences.** People with generalized anxiety disorder may have a history of significant life changes, traumatic or negative experiences during childhood, or a recent traumatic or negative event. Chronic medical illnesses or other mental health disorders may increase risk.

# Complications

Having generalized anxiety disorder can be disabling. It can:

- Impair your ability to perform tasks quickly and efficiently because you have trouble concentrating
- Take your time and focus from other activities
- Sap your energy
- Increase your risk of depression

Generalized anxiety disorder can also lead to or worsen other physical health conditions, such as:

- Digestive or bowel problems, such as irritable bowel syndrome or ulcers
- Headaches and migraines
- Chronic pain and illness
- Sleep problems and insomnia
- Heart-health issues

Generalized anxiety disorder often occurs along with other mental health problems, which can make diagnosis and treatment more challenging. Some mental health disorders that commonly occur with generalized anxiety disorder include:

- Phobias
- Panic disorder
- Post-traumatic stress disorder (PTSD)
- Obsessive-compulsive disorder (OCD)
- Depression
- Suicidal thoughts or suicide
- Substance abuse
